

COP2806C Module 5 Programming Assignment: Using Resource Files

In this assignment we will work with resource files for configuring our application.

The GitHub Classroom assignment repo contains the full Chapter 5 project content from our textbook.

Clone the repo, open the isf6 project in IntelliJ and build the project. Then make the following changes:

- Change the "hello.txt" file used in the resource injection test to a file named "welcome.txt" containing the string "Welcome to COP2806C!". Make the necessary changes to the test code to verify the file content.
- Add a German property file (locale = "de") to the i18nmenu resource bundle (remember from Advanced Java that i18n is short for "internationalization"). The translation for the app.title property is "Meine Dokumente". The translation for Hello is the same as the Dutch translation: "Hallo". Change the greeting name to "Karl". Make the necessary changes to the test code to verify the new locale in addition to the previous two locales.

Submit your changes to the repo and include a screen snip showing successful test execution from the command line after making the modifications.
